The Problem

Knowledge workers spend 5 hours per week on post-meeting admin: updating CRMs, creating tasks, drafting follow-up emails, and posting team summaries. This is manual, error-prone, and the work often never gets done. 100 million managers worldwide face this every day.

5 hrs/week

Per manager wasted on admin

40% of CRM data

Is never updated after meetings

68% of action items

Are never followed up on

ECHO's Solution

A Recall.ai bot auto-joins your meetings.

After the call ends, 5 specialist AI agents fire in sequence to update your CRM, create tasks, draft emails, post Slack summaries — and audit every action back to the audio that caused it.

The 5-Agent Pipeline

01 Action Extractor

Featherless / Llama 3.1

Extracts commitments, deadlines & tasks from transcript

02 Stakeholder Classifier

Featherless / Llama 3.1

Identifies speakers, roles, companies & action owners

03 Decision Maker

Gemini 2.5 Flash

Synthesizes what to do in HubSpot, Linear, Slack, Gmail

04 Comms Drafter

Gemini 2.5 Flash

Writes follow-up emails and Slack summaries

05 Executor

API Orchestrator

Fires real API calls: issues, CRM notes, Slack posts, Gmail drafts

The Originality Moat: Auditable Agentic Memory

Every AI action is traceable back to the exact moment in audio that caused it.

Click 'Why?' on any executed action — ECHO shows:

- The exact 30-second transcript snippet, diarized and speaker-labeled
- The full agent debate chain — what each of the 5 agents decided and why
- Audio playback starting at the precise timestamp in the meeting recording

Core Features

Automatic Bot Join

Recall.ai bot joins any Zoom, Meet, or Teams call via URL. No app install. No calendar permission required.

5-Agent Pipeline

Action Extractor + Stakeholder Classifier (Featherless/Llama) then Decision Maker + Comms Drafter + Executor (Gemini).

Real Integrations

HubSpot CRM, Linear issues, Slack messages, Gmail drafts — fired with real API calls. Nothing mocked, nothing faked.

Semantic Search

Every transcript embedded with Gemini into pgvector on Vultr. Ask anything in natural language. Gemini synthesizes the answer.

Audit Drill-Down

The enterprise trust layer. Click any executed action to see the audio snippet + agent debate that triggered it.

Audio Archive

Meeting recordings stored on Vultr Object Storage. Pre-signed URLs serve audio to the audit player at the right timestamp.

ECHO vs. The Field

Feature	ECHO	Otter.ai	Fireflies	Fellow
Transcription	Yes (Speechmatics)	Yes	Yes	Yes
Speaker Diarization	Yes	Yes	Partial	No
Auto CRM Update	Yes (real API)	No	No	No
Task Creation	Yes (Linear API)	No	No	No
Slack Integration	Yes (real API)	No	No	No
Audit Trail	Yes (audio+AI)	No	No	No
Semantic Search	Yes (pgvector)	No	No	No

Business Value

5 hrs/week saved

Per knowledge worker on post-meeting admin tasks

100M+ target users

Global knowledge workers who attend regular meetings

\$2.5T market

Enterprise productivity software market opportunity

Zero trust gap

Auditable AI actions enterprises can actually deploy

Judging Criteria Mapping

Application of Technology

All 4 sponsor stacks do real work. Recall (capture), Speechmatics (diarization), Featherless (domain agents), Gemini (reasoning + embeddings). Remove any one — the pipeline breaks.

Presentation

Live 2-act demo: pipeline fires in real-time after the meeting ends, then audit drill-down — click any action, hear the exact audio moment that triggered it.

Business Value

5 hrs/week saved per manager. 100M+ knowledge workers. CRM hygiene is measurable. ROI calculable from day one. Targets every manager at this hackathon.

Originality

Auditable agentic AI with persistent memory occupies an empty lane. Otter/Fellow summarize. ECHO executes and lets you audit every decision. No competing team does both.
